Cairo University

04:00 PM
05:00 PM

Lunch

Breastfeeding is best for babies

PREVENTS ANEMIA

HEALTHY GROWTH

EASY DIGESTION

STRONG BONES

IMPORTANT NOTICE

Optimal nutrition for mothers and their babies during the first 1000 days is fundamental for lifelong health. We believe that the best way to feed a baby is to breastfeed. Breast milk provides the ideal balanced diet and protection against illness for babies. A healthy diet during a mother's pregnancy and after her delivery helps build up the stores of nutrients needed to support a healthy pregnancy and to prepare and maintain lactation. Deciding not to breast-feed is difficult to reverse and it has social and financial implications. The unnecessary introduction of partial bottle-feeding or other foods and drinks has a negative effect on breast-feeding. If a mother chooses not to breastfeed, it is important to communicate the messages above and to give instructions on the correct preparation methods, emphasizing that unboiled water, unsterilized bottles or incorrect dilution can all lead to illness for her baby.
